2	Distribution	Open		
3	Type of Document	Technical Report		
4	Document Control Number	NESAC-SR-392-2026		
5	Title	Seasonal Landslide Inventory for the North Eastern Region (NER) - 2025		
6	Number of Pages	64		
7	Author(s)	NERDRR Team for Landslide, NESAC		
8	Scrutiny Mechanism	Prepared by: Dr. Kuntala Bhusan (Project Manager, Landslide, NESAC)	Reviewed/Approved by: Dr. K.K. Sarma (Dy. Project Director, NER-DRR & GH, RSAG)	Controlled by: Dr. S.P. Aggarwal (Project Director, NER-DRR & Director, NESAC)
9	Sponsor(s)	NER-DRR, NESAC		
10	Date of Initiation	January 2026		
11	Date of Publication	January 2026		
12	Abstract	As a part of operational activity under NERDRR programme of NESAC, Umiam, a compendium of reported landslide incidents for the year 2025 compiled from print, online media reports, field surveys and concerned authorities. A total of 374 landslide incidents have been documented for the year 2025 from the different states of the NER, mainly triggered by rainfall. Further, 63 casualties have been reported out of which 12 are from Arunachal Pradesh, 30 from Assam, 2 from Meghalaya, 6 from Mizoram, 1 from Nagaland and 12 from Sikkim. From various locations collapse of road-sections along National/State Highways as well as district roads are reported and are also documented. This report also contains information on 24 hrs total rainfall prior to each event collected from GPM Mission. Wherever possible event locations are verified in terms of precise latitude and longitude, either through field/UAV survey, post-dated satellite imagery and/or media photographs. Accordingly, codification scheme has been assigned. Landslide dimension vis-a-vis spatial resolution of the satellite image, availability of cloud free image, exposure condition of the landslide with respect to hill slope, clearance of slide debris especially along roadside immediately after an event are some of the factors that pose limitations for validation of each and every reported event location through (freely available cloud free optical) satellite data. It also needs to be mentioned that the report is not inclusive of all landslide events that have occurred during the year 2025. The systematic inventory thus compiled will help in assessing the risk in terms of yearly loss of life and property, disruption of transportation network, frequency and magnitude of landslide incidents in an area and NER as a whole. It will also help in carrying out studies related to landslides in NER.

PREFACE

The North Eastern Regional Node for Disaster Risk Reduction (NER-DRR) was established at NESAC, Umiam, in 2011 to provide scientific support for disaster management across the North Eastern Region (NER) of India. The eight states of the NER: Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim, and Tripura are highly susceptible to landslides, except for the alluvial plains of Assam, Manipur, and Tripura. The complex geological settings, combined with steep terrain, contribute to the region's high landslide susceptibility.

Intense and/or prolonged monsoon rainfall and seismic activities are the main triggers of landslides, while human interventions further exacerbate slope instability. This necessitates systematic, date and time-tagged landslide inventory mapping, capturing the precise locations of reported events and their proximity to settlements and critical transportation networks. Accordingly, a vector layer is updated in near real time for every reported event on <https://www.nerdrr.gov.in>, followed by detailed validation and finalization of the corresponding reports.

The systematically compiled inventory is expected to enhance the understanding of seasonal landslide patterns in a spatial context and support risk assessment by documenting annual losses, disruptions to transportation corridors, and the frequency and magnitude of events. Ultimately, this database will serve as a vital input for evidence-based, disaster-resilient planning and developmental decision-making in the North Eastern Region.

Director, NESAC and Project
Director, NER-DRR

1. Introduction

Landslide is described as downslope movement of soil, rock, and slope forming materials characterized by either very slow to sudden and rapid movement (Varnes, 1978). Landslides occur throughout the world in hilly terrain and under all climatic conditions, cost billions in terms of monetary losses, and are responsible for thousands of deaths and injuries each year. Often, they cause long-term economic disruption, population displacement, and negative effects on the natural environment (Highland and Bobrowsky 2008). According to the official data provided by the United Nations International Strategy for Disaster Reduction (UN/ISDR) and the Centre for Research on the Epidemiology of Disasters (CRED) in 2006, landslides ranked as the third most deadly natural disaster (Vordzorgbed 2022). Landslides account for approximately 17% of all fatalities resulting from natural hazards worldwide (Raja et al. 2017). Recent global landslide assessment studies (Petley et al. 2005; Nadim and Kjekstad 2009; OFDA/CRED 2010) reveal that the countries with the highest risk to landslides are mostly in the developing countries. According to Geological Survey of India (GSI) reports, 4.2 lakh sq. km area accounting 12.6% of the Indian landmass is landslide prone and this contributes approximately 8% of global landslide fatalities. Among the vulnerable areas, 0.18 million sq. km lie in the North Eastern Himalaya, encompassing Darjeeling and Sikkim Himalaya, while 0.14 million sq. km are found in the North Western Himalaya, including Uttarakhand, Himachal Pradesh, and Jammu & Kashmir. Additionally, 0.09 million sq. km of susceptible land are situated in the Western Ghats and Konkan hills, spanning Tamil Nadu, Kerala, Karnataka, Goa, and Maharashtra (Jain et al. 2023). The remaining 0.01 million sq. km of risk-prone region exists in the Eastern Ghats of Araku in Andhra Pradesh. Landslides are classified into different types on the basis of the type of movement and the type of material involved. Landslides can be triggered by natural factors, such as heavy rainfall, snowmelt, earthquakes, volcanic eruptions, and erosion, as well as human activities, including deforestation, construction, mining, and improper land use (Van Westen 2000). The extent of damage caused by landslides can vary from minor disturbances to catastrophic events that lead to significant loss of life and destruction of property and infrastructure. Understanding the underlying causes and mechanisms of landslides is essential for effective hazard assessment, prevention, and mitigation efforts to minimize their impact on vulnerable regions and communities and systematic inventory of landslide events is the prerequisite for this.

Under the purview of North Eastern Regional Node for Disaster Risk Reduction (NERDRR) program, a need for immediate cataloguing of landslide incidences and creation of Geospatial database is realized highlighting the landslide location with respect to nearby settlements and

transportation network immediately after the event. Landslide inventories are one of the key requirements for landslide studies (Van Westen et al. 2008).

However, it should be noted that the current database in the report does not encompasses all the events that have occurred during the year 2025 pan NER. The purpose of this work is to prepare a date & time tagged landslide inventory databank which is the primary requirement for assessing rainfall threshod triggering various types of landslides in diverse terrain of NER. This in term will help in preparing an affective landslide alert system for the region. However, in most of the instances it is hard to get time tagged events. Efforts have been made to encompass maximum data with time tagged landslide events for development of landslide alert system.

2. Methodology and Data used

2.1 Landslide point and polygon extraction

To create the Seasonal Landslide Inventory for the monsoon period, an extensive review of relevant articles concerning landslide incidents from major Daily Newspapers in NER was conducted. The locations of all landslide incidents were extracted from these newspaper reports, and an initial database was prepared in the form of a Point Shape file. From all the incidents, those deemed significant enough to be visible on IRS LISS 4/Sentinel 2 imagery are sorted, and a 10 km buffer was established around them to resolve any geo-location uncertainties. Subsequently, using Pre and Post Event Satellite Imagery once available, visible landslide polygons within the 10 km buffer were identified and added to the inventory.

The flowchart for the methodology is displayed in Figure 1.

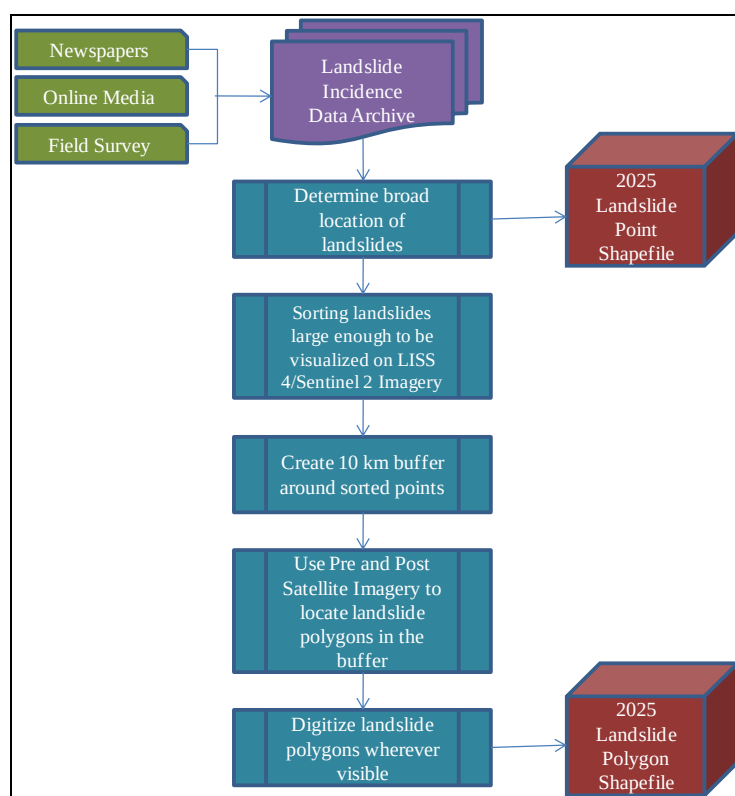

Figure 1 Flowchart of Landslide polygon extraction

2.2 Data Source

Unlike other disasters like earthquakes, so far, landslide incidents are not instrumentally recorded and reported anywhere immediately after the event. Hence, immediate cataloguing of landslide incidents has been done mainly from print (both local and national newspapers) and online/social media. Subsequently, each event location is verified in terms of precise latitude and longitude either through field survey or from post-dated satellite/UAV imagery as and when available. However, landslide dimension vis-a-vis spatial resolution of the satellite image, immediate availability of cloud free image, exposure condition of the landslide with respect to hill slope, clearance of debris slide especially along roadside immediately after an event are some of the factors that pose limitations for validation of each and every reported event location. Accordingly, codes are assigned for every event location. Further, due care is taken to minimise the confusion regarding date and time of occurrences and precise incident locations of reported events.

The data sources contributing to this inventory are categorized into three main groups:

1. Newspapers and online media as immediate information about a landslide event.
2. Satellite/UAV imagery, field photo and location for validation purpose.
3. Global Precipitation Measurement (GPM) mission for corresponding rainfall information.

2.3 Automatic Extraction of News from Online Media

To extract the information related to Landslide events relevant code has been developed by NERDRR IT team. Automatic news extraction script fetches news articles about natural disasters for defined Indian states using the GNews API. It retrieves news based on selected topics such as landslides, hailstorms, flash floods, earthquakes, forest fires, lightning, floods, heavy rainfall, thunderstorms, droughts, avalanches, and extremely heavy rainfall etc. for the states of NE: Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim, and Tripura. For the current purpose news related to landslides only are filtered. The date range is dynamically set to include only articles from the previous day. The fetched articles are filtered to ensure that the topic is mentioned in their descriptions and stored in a list. The data is then saved to a database, and the news entries are inserted into a table. The script checks each entry based on title and post time, to avoid duplication. After the database insertion and clean-up, changes are committed, and the connection is closed. This process automates the collection and storage of landslide hazard/disaster related news during monsoon season.

2.4 Satellite Data

Satellite imageries available post event or post monsoons are used to validate positional accuracy of the landslide locations and for extraction of affected area through polygon features. Freely available imageries from Resourcesat 2/2A (LISS IV MX) and Sentinel 2 Multispectral Instrument (MSI) are mainly used for extraction and updation of landslide features. The details of the sensor specifications are given in Table 1. Latest images from any of the satellite sensors freely available from Google Earth platform are also used to validate the landslide inventory for gap areas (Annexure II).

Table 1 Specifications of the stellite data used

Satellite/Sensor	Spatial Resolution	Revist Time
LISS 4 Mx	5.8 m	5 days
Sentinel 2 (MSI)	10 m	5 days (Two Constellations)

A recently activated landslide area on hill slope appears bright due to exposure of fresh rock and soil and loss/removal of vegetation and other slope forming materials.

2.5 Rainfall Data

Rainfall data from NASA's Global Precipitation Mission (GPM) has been used, considering the seamless availability of rainfall data for the entire NER. The Global Precipitation Measurement (GPM) is an international mission directed by NASA and JAXA, focusing on the provision of advanced global observations of rain and snow. GPM Core Observatory serves as a reference standard combining data from a constellation of partner satellites to provide detailed precipitation measurements (<https://gpm.nasa.gov/>). It involves a key product known as Integrated Multi-satellite Retrievals for GPM (IMERG). IMERG generates high-resolution estimates of precipitation that are derived through the combination of data from many satellites. Various IMERG products are available for different stages: Early, Late, and Final. The "Late Run" product, the GPM IMERG Late Precipitation L3 Half Hourly 0.1-degree x 0.1-degree V07 (GPM_3IMERGHHL), presents precipitation estimates nearly with a latency of 12 hours for implementing these timely applications. The GPM IMERG Late Run V07 product has a spatial resolution of 0.1° x 0.1°, or approximately 10 km x 10 km, and a temporal resolution of 30 minutes. The details of GPM product used are given in the Table 2 below.

Table 2 Specifications of the GPM data used

Plot Type	Variable	Unit	Source	Temporal Resolution	Spatial resolution
Time Series, Area Averaged	Multi-satellite precipitation estimates with climatological gauge calibration - Late Run (GPM_3IMERGHHL v07)	mm/hr	GPM	Half-Hourly	0.1 degree

2.6 Automatic Rainfall Data Extraction

From the list of landslides events, latitude, longitude and date of event are used to extract the corresponding rainfall data using automation pipeline created for this activity. This automation pipeline will first download the required rainfall data from specific sources (Currently GPM data supported) and pre-process them to get hourly precipitation and cumulative precipitation of each event. The flowchart for the methodology behind Automatic Rainfall Data Extraction is shown in Figure 2.

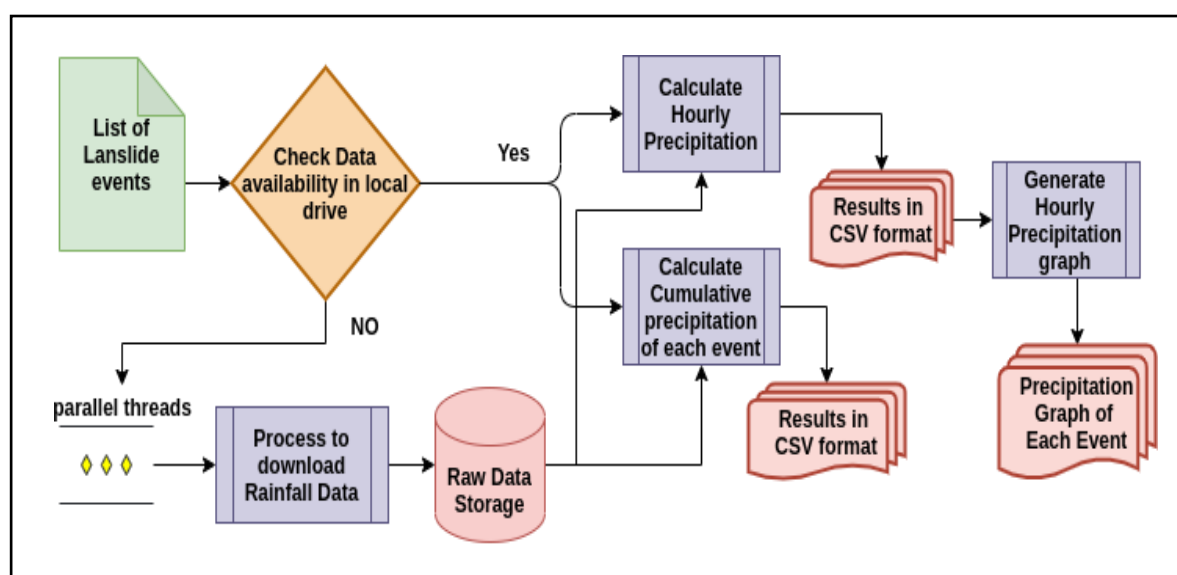

Figure 2 Flowchart for automatic extraction of rainfall

3. Details of the landslide inventory prepared for 2025

The various newspapers being used to gather information for the year 2025 is given in the Table 3 and in Annexure III. Most of the leading daily newspapers distributed in the different states of NER were thoroughly reviewed in addition to online/digital media which plays a significant role in reporting hazard and disaster incidents. Therefore, data collected from newspapers were supplemented with information acquired from online media too. In the context of this inventory; online media includes all the small local/regional news stations that only have an online presence. With the ubiquitous accessibility of internet, often landslide incidents

photographed/recorded by people are shared on different social media platforms. Certain community outreach groups also provide information about recent disasters on such sites. The army also provides updates on X (formerly twitter) whenever they are involved in rescue as well as in clearing landslide debris to facilitate transportation. Examples of the same used in this inventory are provided in the Annexure-III.

Across the different states of NER India, a total of 374 landslide incidents resulting in 63 casualties have been reported. Among these incidents, 28 from Arunachal Pradesh, 91 from Assam, 17 from Manipur, 139 from Meghalaya, 15 from Mizoram, 42 from Nagaland, 28 from Sikkim and 14 from Tripura are reported (Table 4,5, Map 1 & Figure 3). The month wise distribution of landslides is also shown in Figure 4. Moreover, the inventory also includes reports of road-section collapses along National/State Highways/other roads within the NER states. Base and other ancillary information used to correlate the inventory database are of 1:50,000 scale.

On 30-31 May 2025, the Northeast Region (NER) of India witnessed an episode of extreme rainfall, leading to widespread hydro-geomorphic impacts, particularly rainfall-induced landslides across hilly and urban fringe areas. The high-intensity, short-duration rainfall occurred over antecedently saturated slopes, resulting in rapid surface runoff, subsurface pore-pressure build-up, toe erosion, and reduction in slope stability. Consequently, several slope failures were reported, causing road blockages, traffic disruption, damage to road infrastructure, and increased risk of secondary failures along critical transportation corridors. The event also enhanced sediment mobilization and stressed urban drainage systems, especially in densely built-up areas. To document the impacts and prepare a field-validated landslide inventory, post-event field surveys were conducted across multiple affected corridors. On 31 May 2025, a detailed roadside landslide survey was carried out along the GS Road / NH-6 corridor (Mawlai-Jorabat), where landslides triggered on 30 May were mapped. Approximately 28 landslides were documented, recording GPS locations, photographic evidence, failure type, slope conditions, and drainage characteristics. Subsequently, on 1 June 2025, another field survey was conducted along the Shillong-Dawki road (Shillong to Pynursla) to map landslides triggered on 31 May, during which ~46 landslides were identified and systematically documented.

In addition, a rapid field reconnaissance was undertaken in and around Guwahati city, focusing on urban slopes, road cuttings, and hillocks that experienced slope instability during the same rainfall event. This survey captured instances of small to moderate landslides, debris movement, slope distress, and drainage-related failures, highlighting the vulnerability of urbanized hill slopes under extreme rainfall conditions.

Overall, the 30-31 May 2025 extreme rainfall events underscores the growing frequency and impact of climate-driven intense precipitation in the NER and its strong linkage with rainfall-triggered landslides in both hill and urban environments. The multi-location post-event field surveys along GS Road (NH-6), Shillong–Dawki road, and Guwahati urban areas provide critical ground truth for understanding slope response, identifying recurring landslide hotspots, and strengthening landslide early warning systems, risk mitigation strategies, and infrastructure planning in the region.

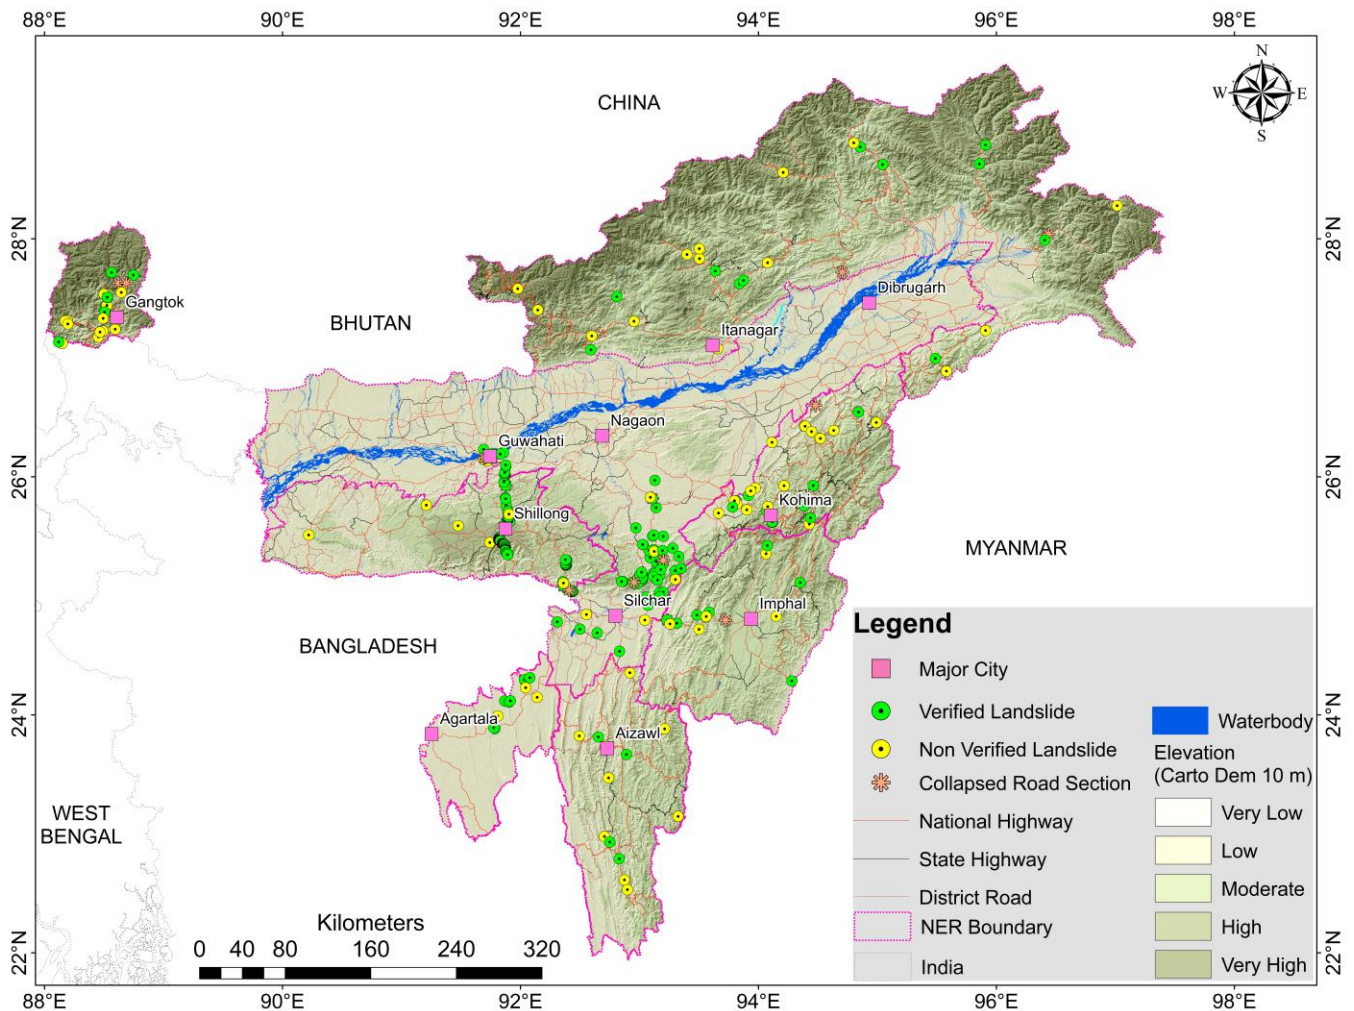

The different categories used post validation in the current inventory is given below:

- TYPE1(Represented by Green Colour)

These are the events, for which precise latitude/longitude information is available. Such events are generally validated from UAV/Satellite Imagery, Field Visits and/or data from the concerned authority. Post-dated satellite imageries are used for validation purpose only where spatial resolution of the image, size and exposure condition of the landslide makes it possible.

- TYPE2 (Represented by Yellow Colour)

These are the events, for which precise latitude/longitude information not available rather is referred with respect to nearby village/settlement or locality name by newspapers/media reports. In most of the case these slides are of smaller dimension and could not be visualized using freely available Resourcesat LISS IV MX and Sentinel 2 data.

Map 1 Landslide Incidents in the NER, 2025

- A 3rd category (TYPE 3) comprises areas where the impact of landslides on road sections along National Highways/State Highways/other roads are reported, resulting in disruptions of transportation. A different symbology (Map 1) is utilized to distinguish these locations. However, validating these areas presents a challenge as road sections are typically restored or repaired promptly, leaving only a limited window for verification through field visits or satellite imagery. Additionally, the revisit status of a particular satellite further complicates the situation.

All the landslide locations also have standard attribute information, in terms of unique ID, location, date/type of events, casualty information, and 24hrs rainfall prior to the event etc. (Annexure V). Due care has been taken to validate all the event locations at the earliest.

4. LANDSLIDE INVENTORY IN DIFFERENT PARTS OF THE NER INDIA

This section of the report depicts a concise overview of landslide incidents across the various states of the NER. Detailed information regarding each landslide incident is provided in the Annexure I.

4.1 Highlights of Landslide incidents in Arunachal Pradesh

- A total of 28 landslide incidents recorded in Arunachal Pradesh.

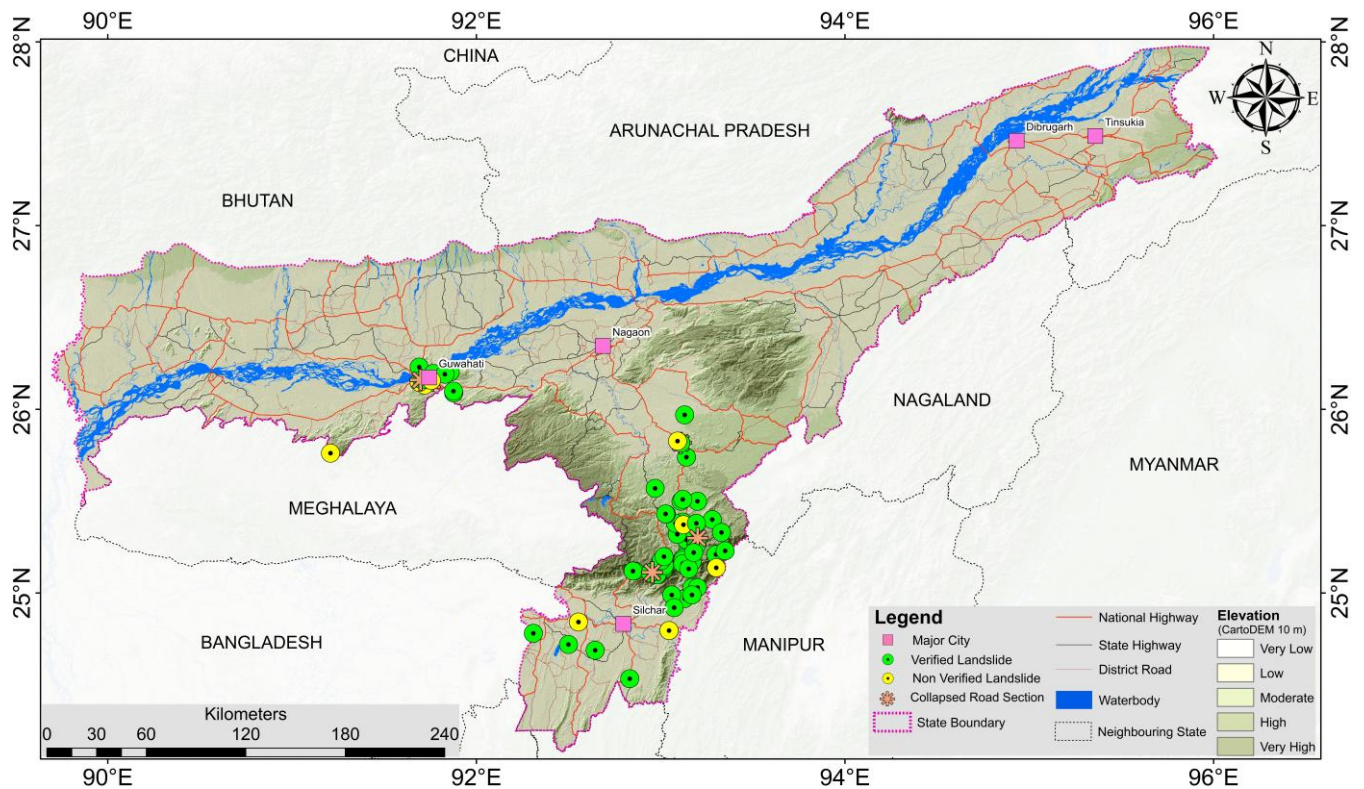

- The first landslide incident for the year was recorded on 26th February 2025 and the latest event was recorded on 1st October 2025.
- There were 12 casualty occurred in Arunachal Pradesh in 2025.
- NH 313, between Hunli and Anini, NH-13 between Bana Seppa Road and Ziro Kamle Road and along Likabali-Basar were some of the highways/road sections that were most affected in the state due to landslides.
- Seven people were killed when their vehicle was swept away by a landslide along Bana Seppa Road on 30th May, 2025.
- The spatial distributions and details of the landslides are shown in Map 2 and Annexure I(I) respectively.

Map 2 Landslide incidents in Arunachal Pradesh, 2025

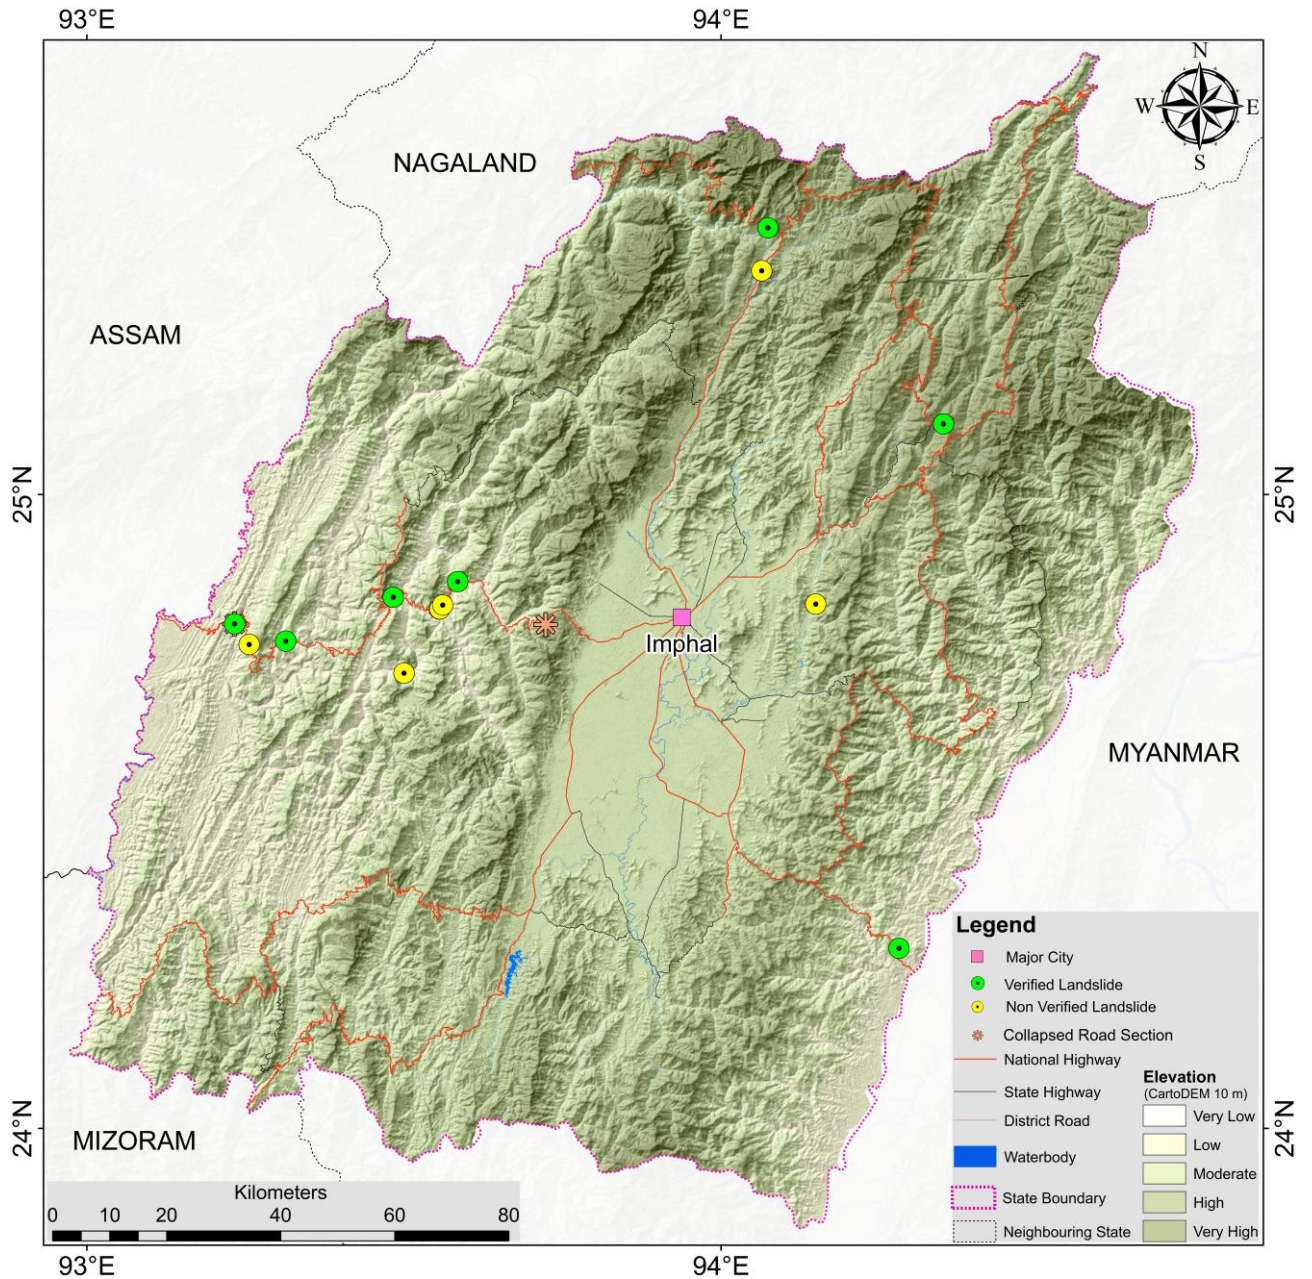

4.2 Highlights of Landslide incidents in Assam

- A total of 91 landslide incidents recorded in Assam in the year 2025.
- The first landslide incident for the year was recorded on 31st March 2025 and the latest event was recorded on 12th October 2025.
- A total of 30 casualties occurred in Assam in 2025.
- Landslide in Assam caused lot of damages to properties and injuries to people.
- The spatial distributions and details of the landslides are shown in Map 3 and Annexure I (II) respectively.

4.3 Highlights of Landslide incidents in Manipur

- A total of 17 landslide incidents recorded in Manipur in the year 2025.
- The first landslide incident for the year was recorded on 30th May 2025 and the latest event was recorded on 17th September 2025.
- Landslides caused lot of disruptions to traffic, damages to infrastructures in Manipur at different occasions following landslides events.
- The spatial distributions and details of the landslides are shown in Map 4 and Annexure I (III) respectively.

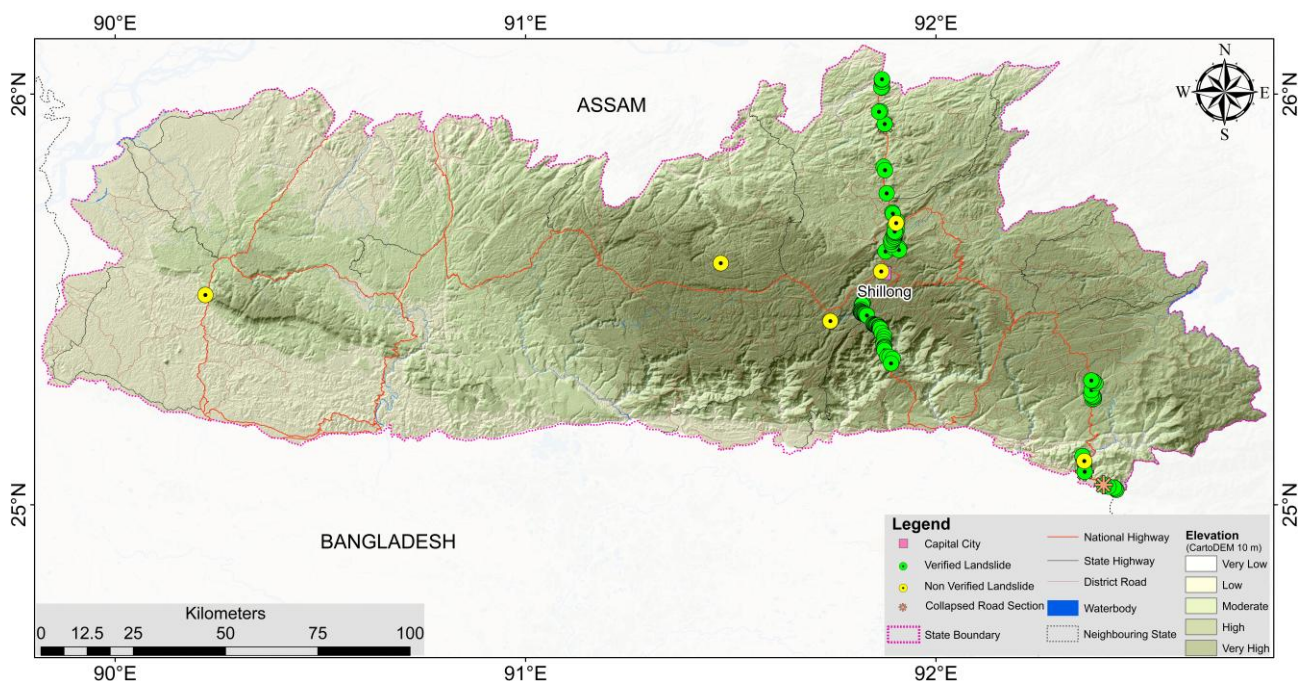

Map 4 Landslide incidents in Manipur, 2025

4.4 Highlights of Landslide incidents in Meghalaya

- A total of 139 landslide incidents recorded in Meghalaya in the year 2025.
- The active landslide near Kuliang Village remained a problem almost throughout the monsoon season while between May and August; at 4 instances it created major issues.
- The first landslide incident for the year was recorded on 18th March 2025 and the latest event was recorded on 20th September 2025.
- 2 casualties were reported from Meghalaya in 2025.

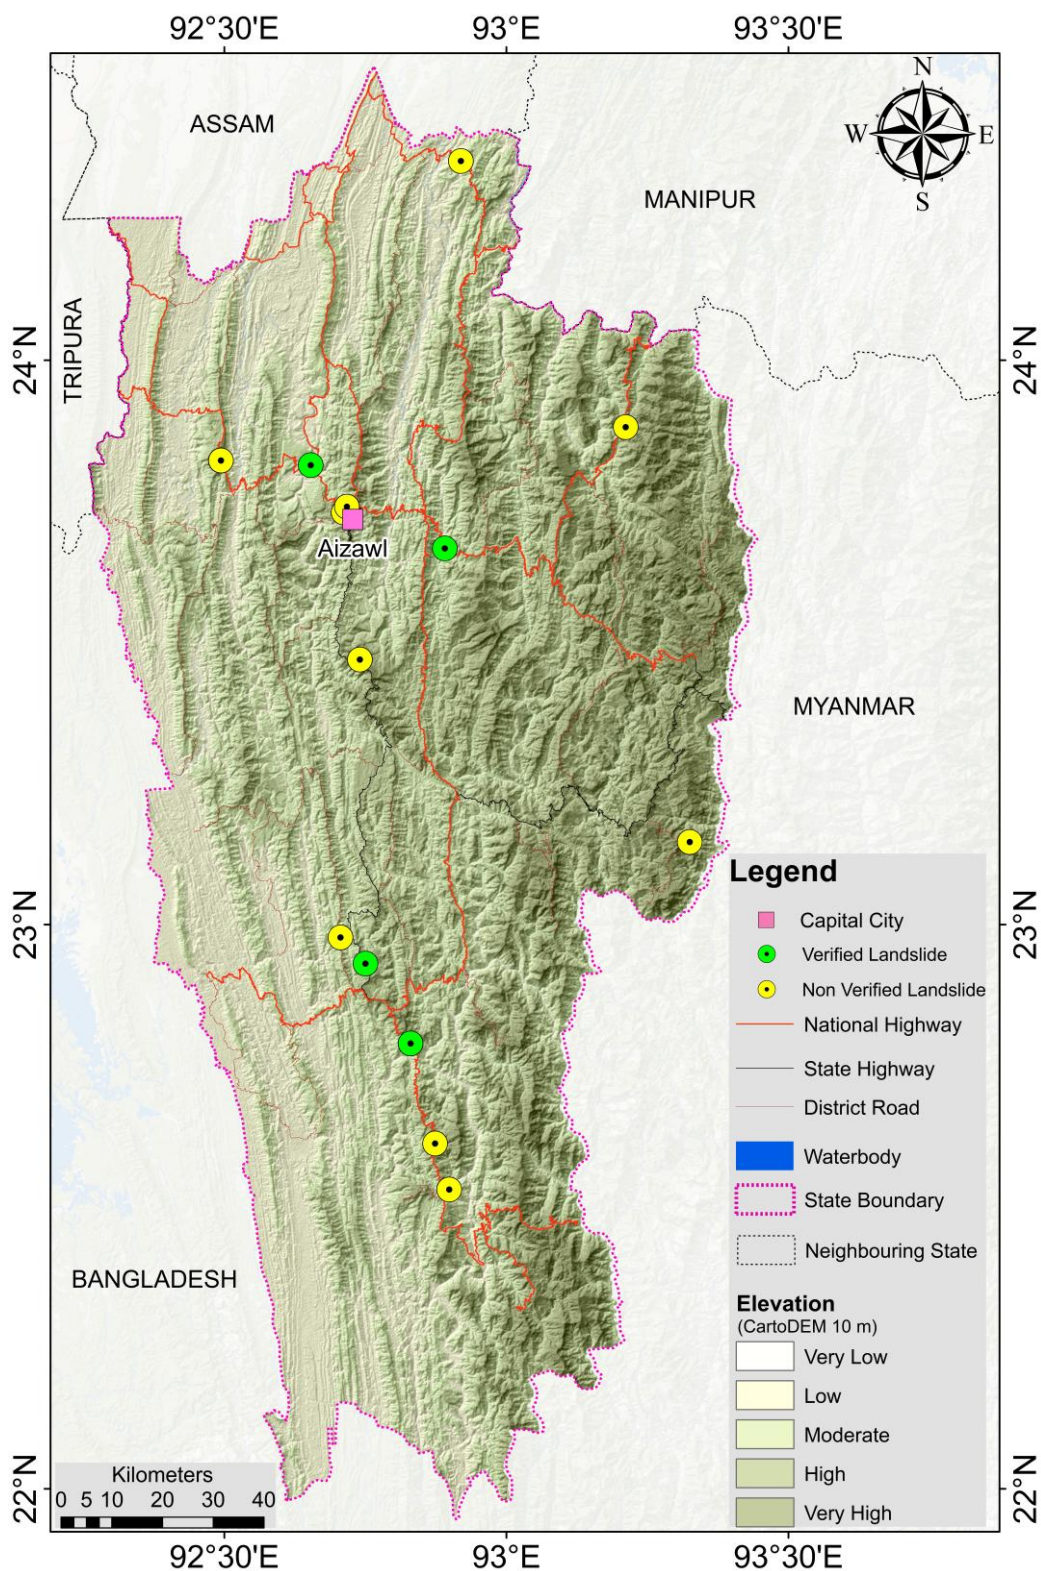

- NH-6 and NH-206 were the highways/road sections that were most affected in the state due to landslides.
- The spatial distributions and details of the landslides are shown in Map 5 and Annexure I (IV) respectively

Map 5 Landslide incidents in Meghalaya, 2025

4.5 Highlights of Landslide incidents in Mizoram

- 15 landslide incidents recorded in Mizoram. The first landslide incident was recorded on 10th May 2025 and the latest event was recorded on 11th September 2025.
- In Bazar Veng Landslide near Lawngtlai Town, Vaphai Landslide near Vaphai Village, and Thuampui Landslide near Thuampui locality casualties and missing of many were reported.
- NH 54, NH 306A, NH 102B, NH 108, NH 2 were the major road sections affected by landslides in Mizoram in 2025.
- The spatial distributions and details of the landslides are shown in Map 6 and Annexure I (V) respectively

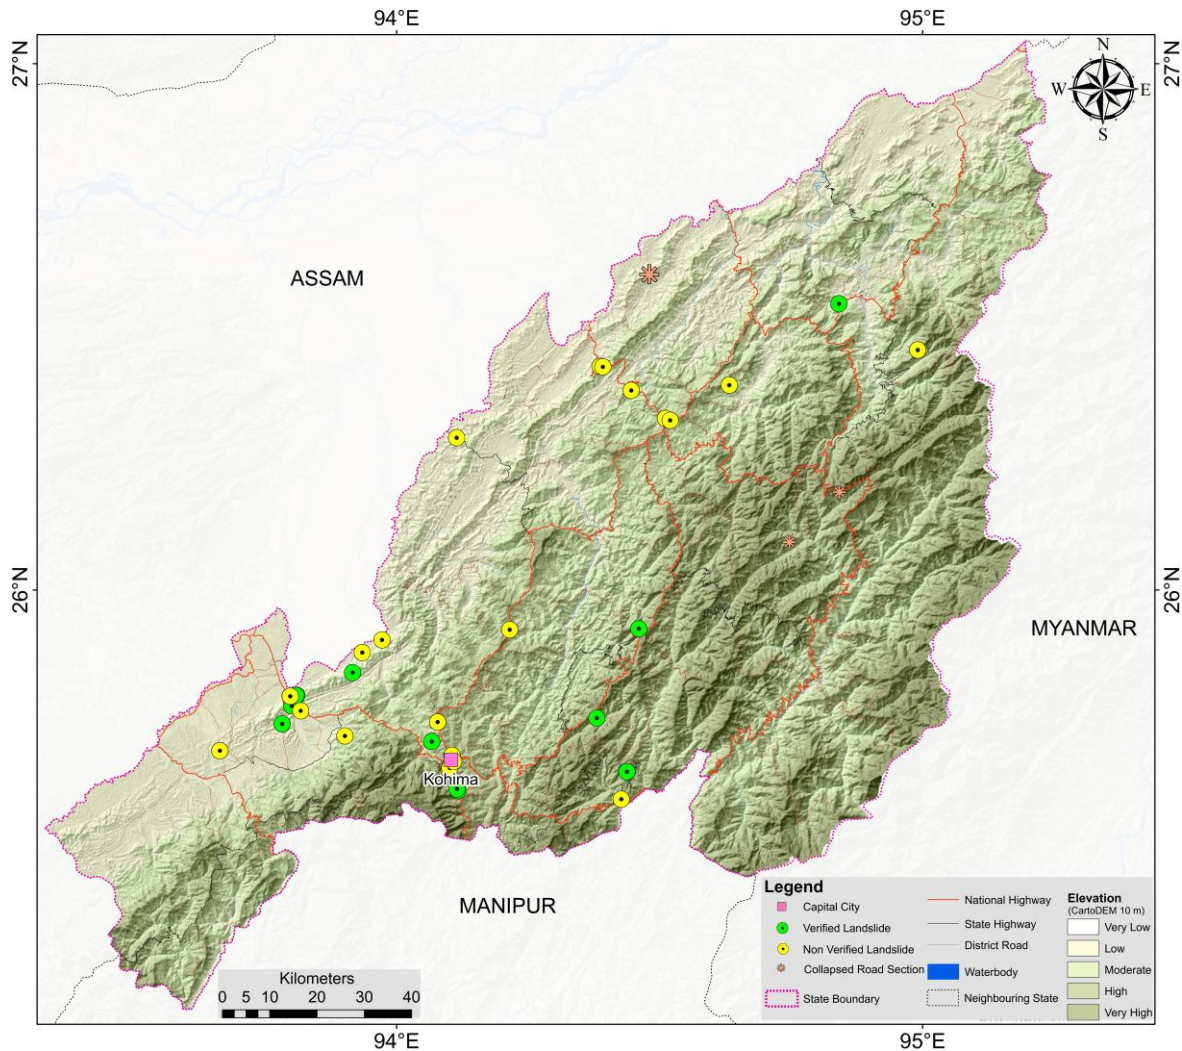

Map 6 Landslide incidents in Mizoram, 2025

4.6 Highlights of Landslide incidents in Nagaland

- A total of 42 landslide incidents recorded in Nagaland in 2025.
- The first landslide incident for the year was recorded on 30th May 2025 and the last event was recorded on 17th September 2025.
- 1 casualty was reported from Nagaland in 2025.

- NH 29, NH 2, NH 702 and SH 4 were the most affected roads due to landslide in 2025.
- The spatial distributions and details of the landslides are shown in Map 7 and Annexure I (VI) respectively.

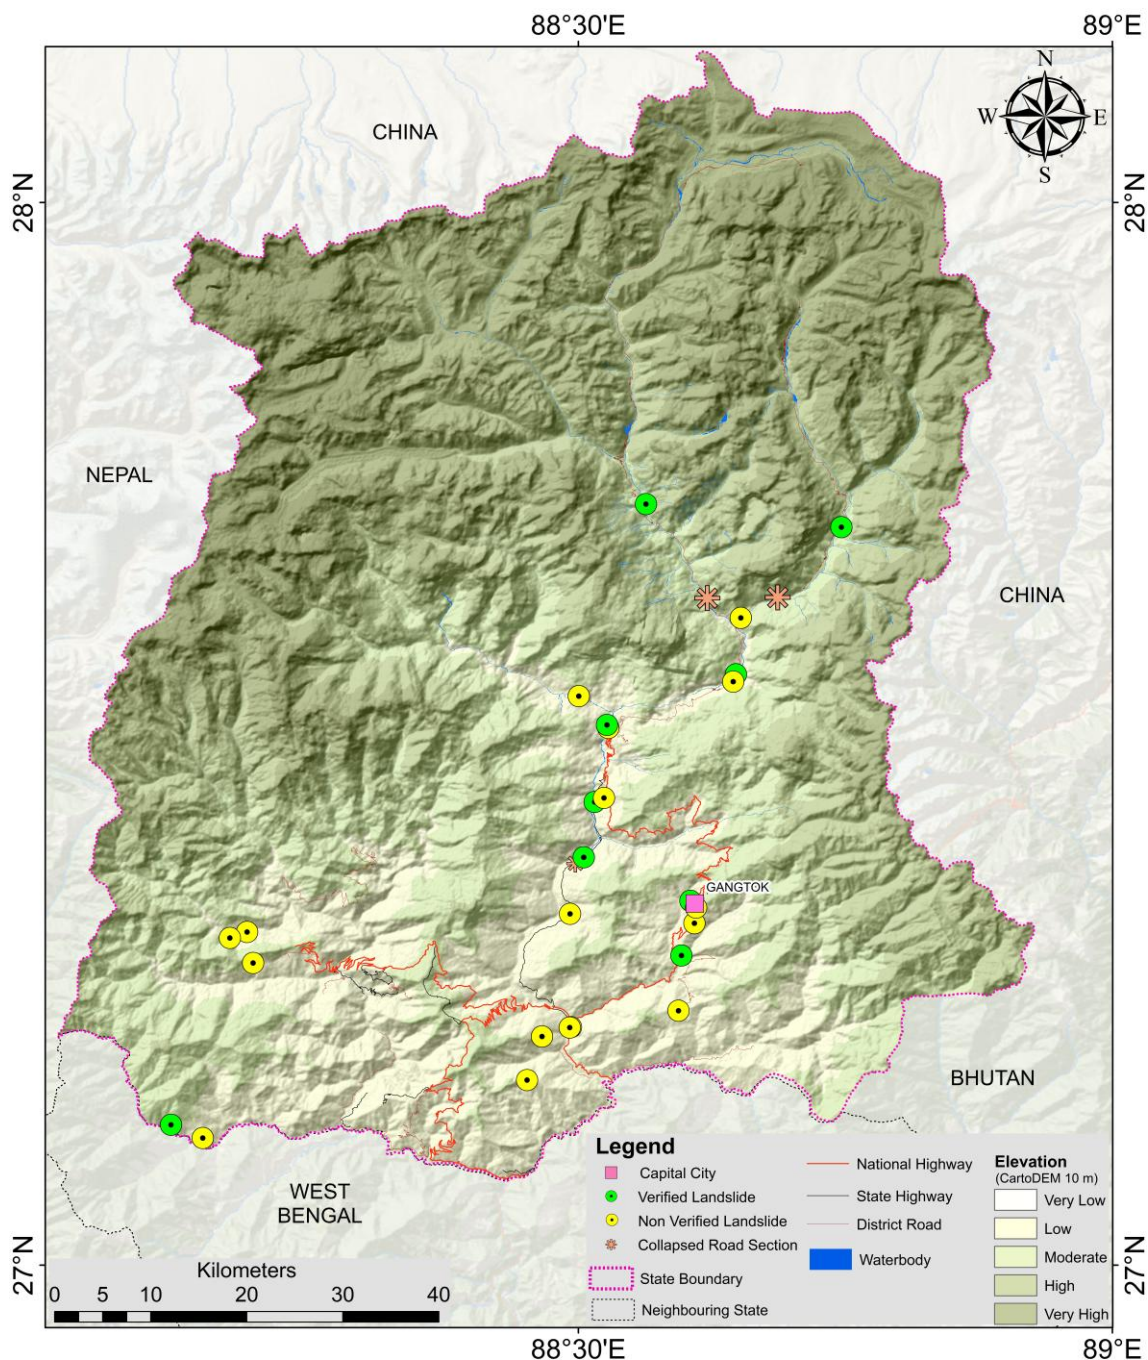

Map 7 Landslide incidents in Nagaland, 2025

4.7 Highlights of Landslide incidents in Sikkim

- 28 landslide incidents recorded in Sikkim in 2025. The first landslide incident for the year was recorded on 24th April 2025 and the latest event was recorded on 14th September 2025.
- 12 casualties were reported from Sikkim in 2025.
- A catastrophic rain-triggered landslide struck Chaten, devastating an Indian Army camp and surrounding area, killing at least three Army personnel with several others reported missing.
- NH 10, NH 310A, NH 310 and NH 717A were among the major road sections affected by landslide.

- The spatial distributions and details of the landslides are shown in Map 8 and Annexure I (VII) respectively.

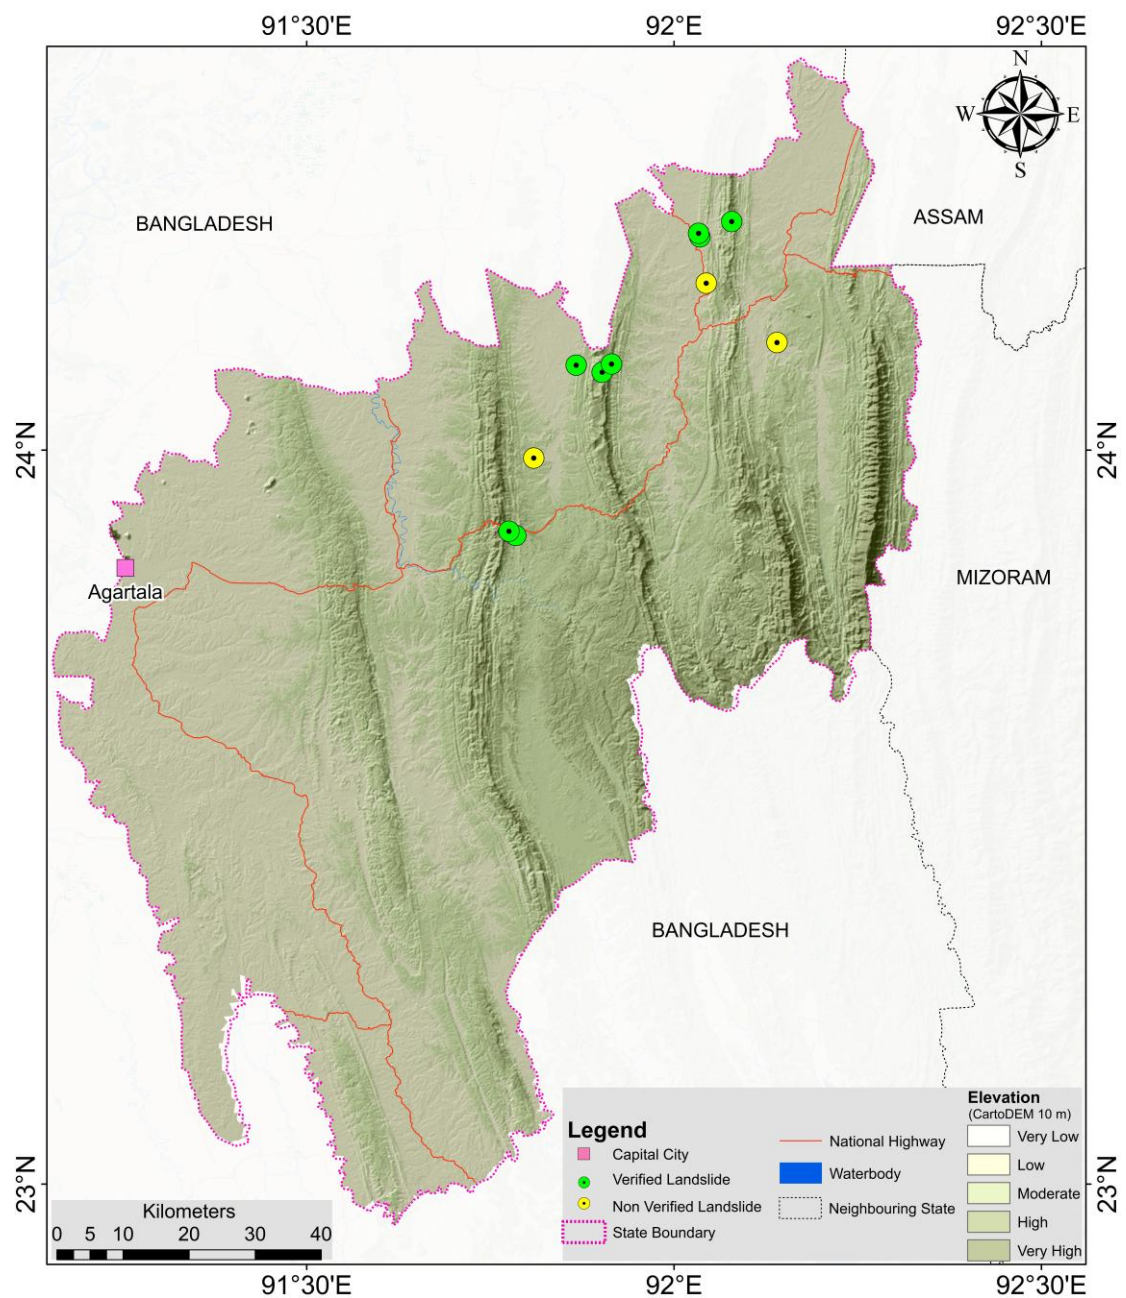

Map 8 Landslide incidents in Sikkim, 2025

4.8 Highlights of Landslide incidents in Tripura

- 14 landslide incidents recorded in Tripura in the year 2025.
- The first landslide incident for the year was recorded on 30th May 2025 and the latest event was recorded on 12th September 2025.
- NH 208A NH 208, NH 8 were among the major road sections affected by landslide.

- The spatial distributions and details of the landslides are shown in Map 9 and Annexure I (VIII) respectively.

Map 9 Landslide incidents in Tripura, 2025

Landslide on NH-6 hits connectivity to Barak Valley

May 20, 2025, 23:08 IST

Silchar: Movement of vehicles along NH-6 in Kuliang of [East Jaintia Hills](#) district of Meghalaya was temporarily halted following a severe landslide caused by incessant monsoon rains on Tuesday morning.

The natural calamity resulted in extensive damage to multiple sections of the road in Kuliang, 68 km from Silchar, leading to significant disruptions in vehicular movement and affecting connectivity to the Barak Valley areas of Assam, Tripura, Mizoram and parts of Manipur.

Guwahati: Incessant rain in Guwahati does not only cause flash floods hampering normal life but also landslides, which are mainly attributed to illegal hill-cutting and the general apathy of the local administration in checking this menace in the hills in and around Guwahati. Landslides on Friday and Saturday claimed five lives and injured several more.

Two dead as landslides, flash floods wreak havoc in state

By: By Our Reporter Date: May 31, 2025

Share post: Facebook Twitter Pinterest WhatsApp LinkedIn Email

SHILLONG, May 30: Torrential rains claimed two lives in East Khasi Hills district of Meghalaya on Friday. Chief Executive Officer of East Khasi Hills District Disaster Management Authority, Shonborling Wajri said a woman, identified as Khasiye Kharkongor (30), died in a landslide that occurred at Landkoting village falling under the Landkoting-Khatang Block. Mother of four, the woman was sleeping in one room with two children while her husband was sleeping in another room with the two other children. The landslide hit the room in which the woman was sleeping. While she died, the two children escaped with injuries. They were taken to Dwer PHC. Wajri, who is also the Additional Deputy Commissioner, said a man had lost his life in the other incident. Samborling Taringa drowned at Wab Kot in Marboma under Poniakolai village while he attempted to cross the river at Khabloli at around 3:30 pm, Wajri said, adding that the body was retrieved and sent for post-mortem. Landslides occurred at many places - Mylliem-Umling road under Kharadong, Lumabak, 11 Km, Langpying, Mylliem-Nanglat road near Mawmaw village in Eastern West Khasi Hills, Aulunggre near the Deputy Commissioner's office in Tura, West Garo Hills and the Baghmara Mahabhabla road in South Garo Hills.
